Problems and solutions for parallel execution of SystemC/TLM

- (1) Which process can be run in parallel?
- (2) How to ensure co-routine semantics?

Problems and solutions for parallel execution of SystemC/TLM

- (1) Which process can be run in parallel?
~> Same simulated time \Rightarrow parallel?
- (2) How to ensure co-routine semantics?
~> run-time monitoring (ScaLe), static analysis (RISC)

Problems and solutions for parallel execution of SystemC/TLM

- (1) Which process can be run in parallel? ← focus of this talk
~> Same simulated time => parallel?
- (2) How to ensure co-routine semantics?
~> run-time monitoring (Scale), static analysis (RISC)

Our proposal = additional constructs:
Desynchronization (1) / **Synchronization (2)** (somehow)

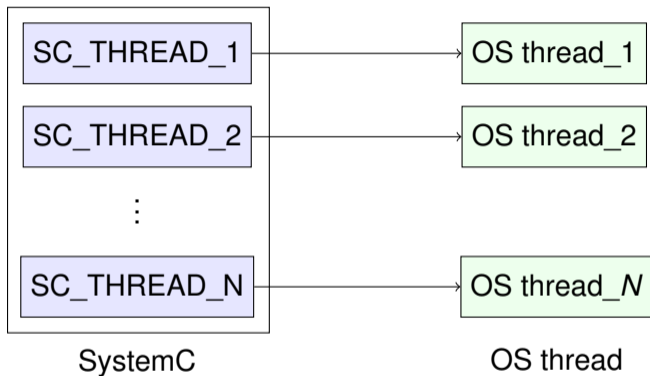

Bad news ...

Number of process (`SC_THREAD` + `SC_METHOD`) per δ -cycle:

(Platform from STMicroelectronics, more data in “Parallel Simulation of Loosely Timed SystemC/TLM Programs: Challenges Raised by an Industrial Case Study”, MDPI 2015)

SC-DURING: The Idea

- Unmodified SystemC
- Some computation delegated to other threads
- Weak synchronization between SystemC and threads thanks to **tasks with duration**

Simulated Time in SystemC and SC-DURING

SystemC

A →

B →

sc-during

P →

Q →

Simulated Time in SystemC and SC-DURING

Process A:

```
// Computation
```

```
f();
```

```
// Time taken by f
```

```
wait(20);
```

Simulated Time in SystemC and SC-DURING

Process A:

```
// Computation
```

```
f();
```

```
// Time taken by f
```

```
wait(20);
```

Process P:

```
g();
```

```
wait(20);
```

Simulated Time in SystemC and SC-DURING

Process A:

```
// Computation
```

```
f();
```

```
// Time taken by f
```

```
wait(20);
```

Process P:

```
g();
```

```
wait(20);
```

```
during(15, h);
```

Simulated Time in SystemC and SC-DURING

Process A:

```
// Computation  
f();  
  
// Time taken by f  
wait(20);
```

Process P:

```
g();  
wait(20);  
during(15, h);
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

SC-DURING: First (Naive) Implementation

```
void during(sc_core::sc_time d,  
           std::function<void()> f) {  
  ① std::thread t(f); // Thread creation  
  ② sc_core::wait(d); // SystemC executes  
  ③ t.join(); // Wait for completion  
}
```

Wait ... are you saying that
parallelization is just about fork/join?

Wait ... are you saying that
parallelization is just about fork/join?

Well, sometimes it is ...

When Things are Easy: Pure Function

Before

```
compute_in_systemc();  
  
// my profiler says it's  
// performance critical.  
// does not communicate  
// with other processes.  
big_computation();  
wait(10, SC_MS);  
  
next_computation();
```

After

```
compute_in_systemc();  
  
// Won't be a performance  
// bottleneck anymore  
during(10, SC_MS,  
       big_computation);  
  
next_computation();
```

Wait ... are you saying that
parallelization is just about fork/join?

Well, sometimes it is ...

Wait ... are you saying that parallelization is just about fork/join?

Well, sometimes it is ...

... and sometimes it isn't

Wait ... are you saying that parallelization is just about fork/join?

Well, sometimes it is ...

... and sometimes it isn't:

Time synchronization: make sure things are executed at the right simulated time

Data/scheduler synchronization: avoid data-race between tasks, processes and the SystemC scheduler.

SC-DURING: Synchronization

`extra_time(t)`: increase current task duration

SC-DURING: Synchronization

`extra_time(t)`: increase current task duration

`catch_up(t)`: block task until SystemC's time reaches the end of the current task

```
while (!c) {  
    extra_time(10, SC_NS);  
    catch_up(); // ensures fairness  
}
```

extra_time(): Sketch of Implementation

- SystemC side:

```
void during(duration, routine) {
    end = now() + duration;
    std::thread t(routine);
    // used to be just sc_core::wait(duration)
    while (now() != end)
        sc_core::wait(end - now());
    t.join();
}
```

- SC-DURING task side:

```
void extra_time(duration) {
    end += duration;
}
```

```
void catch_up() {
    while (now() != end)
        // avoid busy-waiting
        condition.wait();
}
```

Temporal decoupling and SC-DURING

Plain SystemC

```
f();  
// instead of wait(42)  
t_local += 42;  
g();  
t_local += 12;  
  
// Re-synchronize with  
// SystemC time  
wait(t_local);  
t_local = 0;  
  
i();
```

Inside SC-DURING tasks

```
f();  
// instead of wait(42)  
extra_time(42);  
g();  
extra_time(12);  
  
// Re-synchronize with  
// SystemC time  
catch_up();  
  
i();
```

sc_call(): be cooperative for a while

sc_call(f): call function f in the context of SystemC

```
e.notify(); // Forbidden in during tasks
```

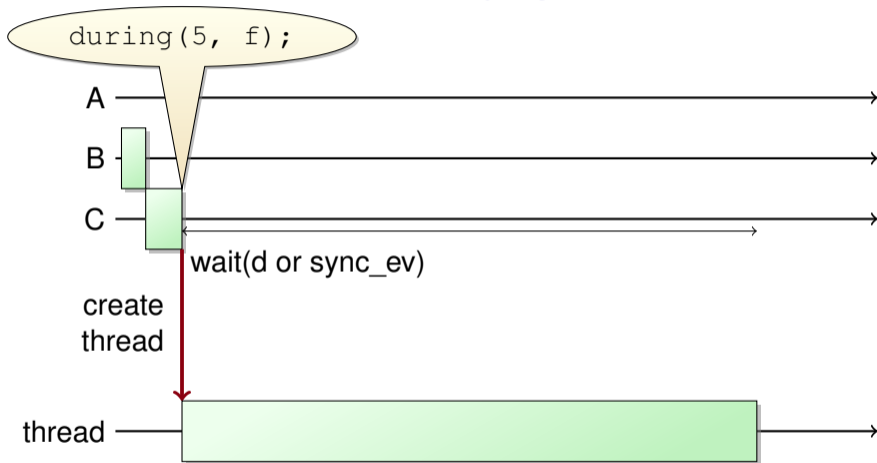

```
sc_call([]{e.notify()});
```

```
sc_call([]{i++});
```

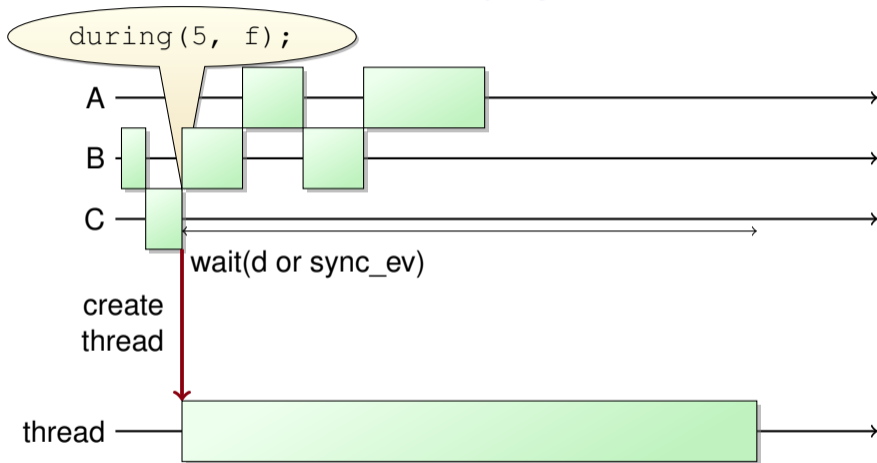

sc_call(): Underlying Mechanism

sc_call: Sketch of Implementation

```
void during(duration, f) {
    end = now() + duration;
    std::thread t(f);
    while (now() != end) {
        // wait sync_ev
        // with timeout:
        sc_core::wait
            (sync_ev, // <--
             end - now());
        if (sc_call_f) {
            sc_call_f(); // <--
            sc_call_f = 0;
            condition.notify();
        }
    }
    t.join();
}
```

```
void sc_call(f) {
    sc_call_f = f;
    // Implemented w/
    // async_request_update()
    async_notify_event
        (sync_ev);
    while(sc_call_f != 0) {
        condition.wait();
    }
}
```

SC-DURING: Implementations

Strategies:

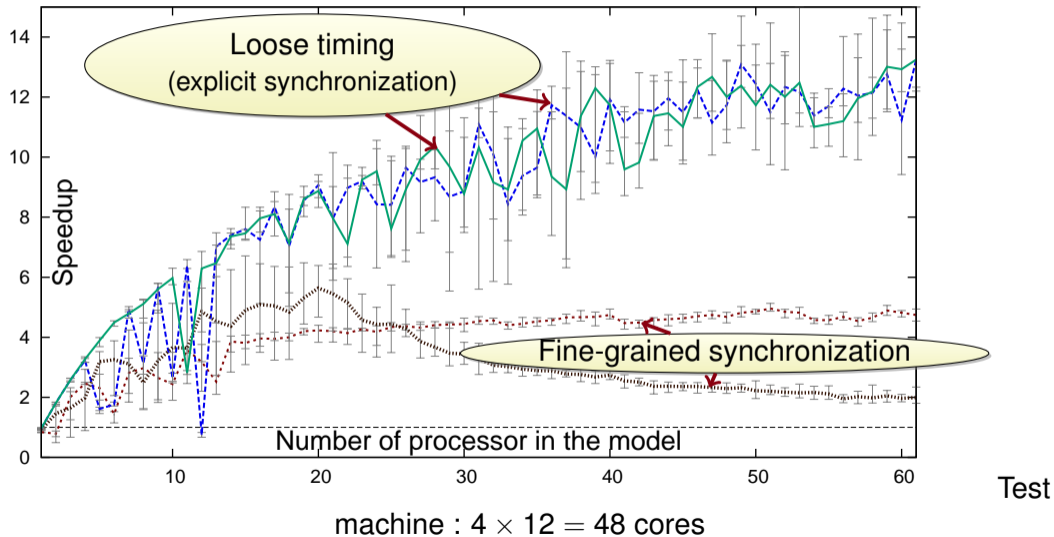

SEQ Sequential (= reference)

THREAD Thread creation + destruction for each task

POOL Pre-allocated set of threads

ONDEMAND Thread created on demand and reused

SC-DURING: Results

SC-DURING: Conclusion

- New way to express concurrency in the platform
- Allows parallel execution of loosely-timed (clockless) systems
- No modification of SystemC \Rightarrow could work with a parallel SystemC kernel
- Possible improvement: performance optimizations (e.g. atomic operations + polling instead of system calls)

Try it:

`https://moy.gitlab.io/sc-during/`

Whishlist for Standard

- No change needed, sc-during already works ;-)
- Implementation detail: better way to implement `sc_call` would be nice
- More general: letting the user express loose timing directly in SystemC?

Whishlist for Standard
